

Tell your family and neighbours

Hi Joseph. Are you feeling better?

Hi! I am much better thank you.
The dispensary used a new test for malaria called mRDT. It showed that I did not have malaria.
The health worker explained to me that antimalarials would not help.
He advised me to rest and take paracetamol.
Now I am fine.

Use this leaflet to tell others about the new malaria test

The only way to know if we or our children have malaria is to be tested.

At the dispensary there is a new quality test for malaria called mRDT. I tested negative for malaria.

Health workers explained to me that now malaria is decreasing, we can expect more negative results in our area.

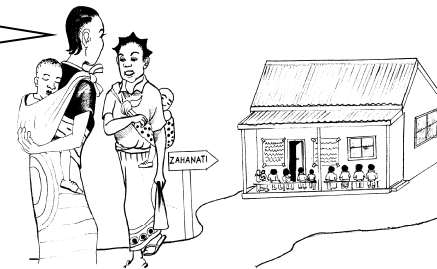

We are happy that fewer people have malaria these days.
We know to trust the advice of health workers after they test for malaria!

This leaflet has been prepared by:
Joint Malaria Programme (JMP- KCMC),
P.O. Box 2228 Moshi, Kilimanjaro, Tanzania.

When you think you or your child has malaria.

I am taking Juma to the dispensary.
He is not well today.

In this dispensary, we are now using this new malaria test called malaria Rapid Diagnostic Test in short mRDT.

It is a real good test. I will take a drop of Juma's blood and test to see if he has malaria

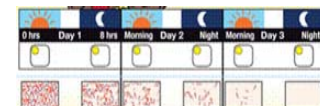

This is the new malaria test called malaria Rapid Diagnostic Test (mRDT).

In 20 minutes the test will give correct results by itself, to show if there is malaria.

The mRDT shows Juma has Malaria.

Be sure to give him one tablet in the morning and one in the evening for 3 days.

Do you have any questions mama?

Thank you. I understand Juma must finish all of the malaria tablets even if he looks better because we need to kill all the parasites.
